## 1.0 DESCRIPTION AND FEATURES

### 1.1 General Description

WD Purple Surveillance Storage is built for 24/7 always-on surveillance in high-definition security systems that utilize higher hard drive bay counts. Exclusive AllFrame 4K™ technology works with ATA streaming to reduce error pixelation and video interruptions that occur when desktop hard drives are incorrectly used as storage in security systems.

### 1.2 Product Features

- **Serial ATA (SATA)** — Serial ATA (SATA) is the industry standard bus interface for hard drives. It offers many advantages including increased transfer rate, improved signal integrity, enhanced data protection, and hot plug support.
- **AllFrame 4K™ Technology** — All WD Purple™ drives are equipped with AllFrame 4K™ technology, which improves ATA streaming to help reduce frame loss, improve overall video playback, and increase the number of hard drive bays supported within a NVR. Help make your surveillance solution future-ready knowing that WD Purple™ drives are ready for ultra high definition cameras.
- **Premium Protection** — Designed with tarnish-resistant components, this WD Purple drive offers premium protection in harsh environments where surveillance systems may be installed.
- **IntelliSeek™** — Calculates optimum seek speeds to lower power consumption, noise, and vibration.
- **Dynamic Fly Height Control** — Designed to compensate for head/media separation changes due to temperature and altitude. This feature adds video quality margins across temperature and altitude changes.
- **Perpendicular Magnetic Recording (PMR)** — With PMR technology the magnetization of each data bit is aligned vertically to the spinning disk. This enables more data on a given disk and provides a platform for future expansion of hard drive densities.
- **NoTouch™ Ramp Load Technology** — The recording head never touches the disk media ensuring significantly less wear to the recording head and media as well as better drive protection in transit.
- **Dual Actuator Technology** — A head positioning system with dual-stage actuators that improves positioning accuracy over the data track(s). The primary stage provides course displacement; the secondary stage uses piezoelectric motion to fine tune the head positioning to a higher degree of precision.
- **Advanced Format (AF)** — Technology adopted by Western Digital and other drive manufacturers as one of multiple ways to continue growing hard drive capacities. AF is a more efficient media format that enables increased areal densities.
- **Native Command Queuing (NCQ)** — Performance of a random I/O workload can be improved through intelligent re-ordering of the I/O requests so they read/write to and from the nearest available sectors and minimize the need for additional disk revolutions or head actuator movement. This improvement can be achieved through Native Command Queuing (NCQ), which is supported by these hard drives.

- **Pre-emptive Wear Leveling (PWL)** — This Western Digital feature provides a solution for protecting the recording media against mechanical wear. In cases where the drive is so busy with incoming commands that it is forced to stay in a same cylinder position for a long time, the PWL control engine initiates forced seeks so that disk lubricant maintains an even distribution and does not become depleted. This feature ensures reliability for applications that perform a high incidence of read/write operations at the same physical location on the disk.
- **S.M.A.R.T. Command Transport (SCT)** — The SCT Command Transport feature set provides a method for a host to send commands and data to a device and for a device to send data and status to a host using log pages.
- **World Wide Name (WWN)** — The World Wide Name (WWN) defined in ATA/ATAPI-7 is a modification of the IEEE extended unique identifier 64 bit standard (EUI-64) and is comprised of three major components: naming authority, organizationally unique identifier (OUI) and serial number. Western Digital's OUI is 0014EEh.
- **Reliability Features Set-Data Lifeguard™** — Representing Western Digital's ongoing commitment to data protection, Data Lifeguard includes features that enhance the drives ability to prevent data loss. Data Lifeguard data protection utilities include thermal management, an environmental protection system, and embedded error detection and repair features that automatically detect, isolate, and repair problem areas that may develop over the extended use of the hard drive. With these enhanced data reliability features, the drive can perform more accurate monitoring, error repair, and deliver exceptional data security.
- **Hot Plug Support** — SATA supports hot plugging (also known as "hot swapping"), the ability to swap out a failed hard drive without having to power down the system or reboot. This capability contributes to both data availability and serviceability without any associated downtime, making it a critical feature for extending SATA into enterprise applications.
- **Active LED Status** — The drive supports external LED requirements. It provides an activity LED output which is ON during command execution and OFF otherwise.
- **Fluid Dynamic Bearings (FDB)** — Bearing design that incorporates a layer of high-viscosity lubricant instead of ball bearings in the hard drive spindle motor. FDB designs provide increased non-operational shock resistance, speed control, and improved acoustics.
- **Staggered Spin-Up** — A feature that allows the system to control whether the drive will spin up immediately or wait until the interface is fully ready (available for specific OEM configurations).
- **Power Management** — The drive supports the ATA and SATA power management command set, allowing the host to reduce the power consumption of the drive by issuing a variety of power management commands.
- **Self-Monitoring, Analysis, and Reporting Technology (S.M.A.R.T.)** — S.M.A.R.T. enables a drive's internal status to be monitored through diagnostic commands at the host level and during offline activities. S.M.A.R.T. devices employ data analysis algorithms that are used to predict the likelihood of some near-term degradation or fault conditions. When used with a S.M.A.R.T. application, the drive can alert the host system of a negative reliability status condition. The host system can then warn the user of the impending risk of data loss and recommend an appropriate action.

- **ATA Security** — The drive supports the ATA Security Mode Feature set. The ATA Security Mode feature set allows the user to create a device lock password that prevents unauthorized hard disk access even if the drive is removed from the host computer. The correct password must be supplied to the hard drive in order to access user data. Both the User and Master Password features are supported, along with the High and Maximum security modes. The Master Password Revision code is also supported. This feature varies by drive configuration and may not be available on all configurations.

## 2.0 SPECIFICATIONS

### 2.1 Performance Specifications

Table 2-1. Performance Specifications

|   |   |
|---|---|
| Rotational Speed  | 5400 RPM  |
| Data Transfer Rate <sup>1</sup><br>- Buffer to Host<br>- Host to/from Drive | 6 Gb/s maximum<br><u>Up to</u> 180 MB/s sustained |
| Buffer Size   | 256 MB  |
| Error Rate - Unrecoverable  | <1 in 10 <sup>14</sup> bits read                  |
| Spindle Start Time<br>- From Power-on to Drive Ready <sup>2</sup>           | 12s average                                       |
| Load/Unload Cycles <sup>3</sup>   | 300,000   |

<sup>1</sup> As used for buffer or cache, one megabyte (MB) = 1,048,576 bytes. As used for transfer rate or interface, megabyte per second (MB/s) = one million bytes per second, and gigabit per second (Gb/s) = one billion bits per second. Effective maximum SATA 6 Gb/s transfer rate calculated according to the Serial ATA specification published by the SATA-IO organization as of the date of this specification sheet. Visit [www.sata-io.org](http://www.sata-io.org) for details.

<sup>2</sup> Defined as the time from power-on to the setting of Drive Ready.

<sup>3</sup> Controlled unload at ambient condition.

### 2.2 Physical Specifications

Table 2-2. Physical Specifications<sup>1,2</sup>

| Model Number              | WD63PURU-69C4FYx             | WD42PURU-69C4CYx             |
|---------------------------|------------------------------|------------------------------|
| Capacity <sup>2</sup>     | 6TB                          | 4TB                          |
| Interface                 | SATA 6 Gb/s                  | SATA 6 Gb/s                  |
| Number of Disks           | 3                            | 2                            |
| Data Surfaces             | 6                            | 4                            |
| Number of Heads           | 6                            | 4                            |
| Physical bytes per sector | 4096                         | 4096                         |
| Host bytes per sector     | 512                          | 512                          |
| User Sectors per Drive    | 11,721,045,168               | 7,814,037,168                |
| Servo Type                | Embedded                     | Embedded                     |
| Recording Method          | LDPC-Low Density Parity Code | LDPC-Low Density Parity Code |

<sup>1</sup> Specifications represented are of a typical production drive and may be subject to change or variation without notice.

<sup>2</sup> As used for storage capacity, one megabyte (MB) = one million bytes, one gigabyte (GB) = one billion bytes, and one terabyte (TB) = one trillion bytes. Total accessible capacity varies depending on operating environment. As used for buffer or cache, one megabyte (MB) = 1,048,576 bytes. As used for transfer rate or interface, megabyte per second (MB/s) = one million bytes per second, and gigabit per second (Gb/s) = one billion bits per second. Effective maximum SATA 3 Gb/s transfer rate calculated according to the Serial ATA specification published by the SATA-IO organization as of the date of this specification sheet. Visit [www.sata-io.org](http://www.sata-io.org) for details.

### 2.2.1 Physical Dimensions

Table 2-3. Physical Dimensions

|        | English      |            | Metric    |           |
|--------|--------------|------------|-----------|-----------|
|        | Dimension    | Tolerance  | Dimension | Tolerance |
| Height | 1.028 inches | MAX        | 26.1 mm   | MAX       |
| Length | 5.787 inches | MAX        | 147.0 mm  | MAX       |
| Width  | 4.00 inches  | ±0.01 inch | 101.6 mm  | ±0.25 mm  |
| Weight | 1.26 pounds  | ±10%       | 0.57 kg   | ±10%      |

## 2.3 Mechanical Specifications

Figure 2-1 shows the mounting dimensions and locations of the screw holes for the drive.

Note: Unless otherwise specified, all measurements are in millimeters.

Figure 2-1. Mounting Dimensions

## 2.4 Electrical Specifications

### 2.4.1 Current Requirements and Power Dissipation

All values are typical (25°C, 5.0V, and 12V input). 3.3V Serial ATA power not utilized in this product.

Table 2-4. Current Requirements and Power Dissipation

| Operating Mode   | Mean Current |        | Power, Average |
|------------------|--------------|--------|----------------|
|                  | 12 VDC       | 5 VDC  |                |
| Spinup (max)     | 1.75 A       | –      | –              |
| Read/Write (avg) | 230 mA       | 380 mA | 4.7 W          |
| Idle (avg)       | 220 mA       | 320 mA | 4.3W           |
| Standby (avg)    | 10 mA        | 35 mA  | 0.3 W          |
| Sleep (avg)      | 10 mA        | 35 mA  | 0.3 W          |

### 2.4.2 Input Voltage Requirements

The input voltage requirements are +5.0V  $\pm$  5% and +12.0V  $\pm$  10%.

Table 2-5. Current Requirements and Power Dissipation

| Power Supply Voltage | Power Supply Tolerance | Ripple (Peak to Peak) | Ripple Freq Range |
|----------------------|------------------------|-----------------------|-------------------|
| +5 Volts Supply      | $\pm$ 5%               | 100 mV                | 0 - 30 MHz        |
| +12 Volts Supply     | $\pm$ 10%              | 200 mV                | 0 - 30 MHz        |

**CAUTION:** To avoid damage to the drive electronics, power supply voltage must not exceed specifications.

### 2.4.3 Voltage Ripple

Table 2-6. Voltage Ripple

|         | Maximum (mV pp) | MHz  |
|---------|-----------------|------|
| +5V DC  | 100             | 0-30 |
| +12V DC | 200             | 0-30 |

## 2.5 Environmental Specifications

### 2.5.1 Shock and Vibration

Table 2-7. Shock and Vibration

| Shock   |  |       |     |     |       |       |
|---|--|-------|-----|-----|-------|-------|
| Operating   | 70G, 2 ms (read/write)   |       |     |     |       |       |
| Non-operating (2 ms)  | 250G   |       |     |     |       |       |
| Note: Half-sine wave, measured without shock isolation and without non-recoverable errors.  |  |       |     |     |       |       |
| Vibration   |  |       |     |     |       |       |
| Operating   | Linear: 20-300 Hz, 0.75G (0 to peak)<br>Random: 0.008 g <sup>2</sup> /Hz (10-300 Hz) |       |     |     |       |       |
| Non-operating   | Linear: 20-500 Hz, 4.0G (0 to peak)<br>Random: 0.05 g <sup>2</sup> /Hz (10-300 Hz)   |       |     |     |       |       |
| Sweep Rate  | 0.5 octave/minute minimum  |       |     |     |       |       |
| Rotational Vibration <sup>1</sup>   |  |       |     |     |       |       |
| 12.5 rad/sec <sup>2</sup> based on the following PSD profile maintaining < 20% degradation: |  |       |     |     |       |       |
| Frequency (Hz)  | 20   | 200   | 300 | 900 | 1400  | 1500  |
| (Rad/sec <sup>2</sup> ) <sup>2</sup> /Hz  | 0.035  | 0.035 | 0.2 | 0.2 | 0.002 | 0.002 |
| Rotational Shock Non-Operating  |  |       |     |     |       |       |
| Amplitude   | 20K rad/sec <sup>2</sup>   |       |     |     |       |       |
| Duration  | 2 ms   |       |     |     |       |       |

<sup>1</sup> Rotational vibration spec is applicable to 4TB and 6TB only.

### Operating Vibration

Drives are tested by applying a random excitation in each linear axis, one axis at a time. The drive incurs no physical damage and no hard errors while subjected to continuous vibration not exceeding the level listed in Table 2-7. Operating performance may degrade during periods of exposure to continuous vibration.

### Non-Operating Vibration

*Note:* This specification applies to handling and transportation of unmounted drives.

Drives are tested by applying a random excitation in each linear axis, one axis at a time. The drive incurs no physical damage when subjected to continuous vibration not exceeding the level listed in Table 2-7.

### Packaged Shock and Vibration

The shipping packaging is designed to meet the National/International Safe Transit Association (N/ISTA) standards for packaged products. The drive incurs no physical damage when subjected to the N/ISTA standards.

## 2.5.2 Temperature and Humidity

The system environment must allow sufficient air flow to limit maximum surface temperatures as defined. Drive temperature refers to temperature reported via the S.M.A.R.T. Command Transport Temperature Reporting (SCT TR) feature. AFR can be affected by workload and operating temperature.

See *Section 2.6 Reliability Specification and Characteristics on page 18* for further details.

Table 2-8. Temperature and Humidity

| Temperature & Humidity                 |   |
|--|---|
| Operation                              |   |
| Min-Max Drive Temperature <sup>1</sup> | 0°C to 65°C (32°F to 149°F)                             |
| Humidity                               | 5-95% RH non-condensing<br>37.7°C (maximum wet bulb)    |
| Thermal Gradient                       | 20°C/hour (maximum)                                     |
| Humidity Gradient                      | 20%/hour (maximum)                                      |
| Non-Operation                          |   |
| Temperature                            | -40°C to 70°C on the drive temperature (-40°F to 158°F) |
| Humidity                               | 5-95% RH non-condensing<br>40°C (maximum wet bulb)      |
| Thermal Gradient                       | 30°C/hour (maximum)                                     |
| Humidity Gradient                      | 20%/hour (maximum)                                      |

<sup>1</sup> Operating at elevated drive temperatures will result in a higher AFR.

### 2.5.3 Cooling

If forced air cooling is required, the drive must be positioned to receive airflow from one or more fans as indicated in Figure 2-2.

Figure 2-2. Forced Airflow Direction

### 2.5.4 Atmospheric Pressure

Table 2-9. Atmospheric Pressure

| Altitude      |   |
|---------------|---|
| Operating     | -1,000 feet to 10,000 feet (-305M to 3,050M)  |
| Non-operating | -1,000 feet to 40,000 feet (-305M to 12,200M) |

### 2.5.5 Atmospheric Condition

Environments that contain elevated levels of corrosives (e.g., hydrogen sulfide, sulfur oxides, or hydrochloric acid, sulfurous gases, chlorine and nitric oxide) should be avoided and ideally kept below G2 severity level defined in ISA-71.04-1985. Care must be taken to avoid using any compound/material in a way that creates an elevated level of corrosive materials in the atmosphere surrounding the disk drive. Vulcanized rubber is an example of a material which may contain corrosive compound/materials.

Care must also be taken to avoid the use of any organometallic (e.g., organosilicones or organotins) compound/material in a way that creates elevated vapor levels of these compounds/materials in the atmosphere surrounding the disk drive.

Silicone based Thermal Interface Materials (TIM), silicone-based tapes, caulking/RTV pastes, silicone rubbers and silicone oil lubricants are examples of materials which may create elevated vapor levels of organometallic compound/materials.

Use of the disk drive in these abnormal or other chemically-challenging environments is not recommended and increases the risk for failure. If any of these materials are considered in system design, it is recommended to consult with Western Digital Corporation.

## 2.5.6 Acoustics

Table 2-10. Acoustics

| TYPICAL SOUND POWER LEVEL <sup>1</sup> |    |
|--|----|
| Idle Mode (average dBA) <sup>2</sup>   | 23 |
| Seek Mode (average dBA)                | 27 |

<sup>1</sup> Measured per ECMA-74/ISO 7779.

<sup>2</sup> No audible pure tones.

## 2.5.7 RoHS (Restriction of Hazardous Substances)

WD complies with the Restriction of Hazardous Substances (RoHS) Directive 2011/65/EU of the European Parliament, which is effective in the EU beginning July 8, 2011. RoHS aims to protect human health and the environment by restricting the use of certain hazardous substances in new equipment, and consists of restrictions on lead, mercury, cadmium, and other substances.

## 2.6 Reliability Specification and Characteristics

The Average Annualized Failure Rate (AFR) calculations assumes operation at nominal voltages, a drive temperature of 40°C, and the workload usage of a typical surveillance environment. Workload is defined as the number of bytes transferred by the user to/from the drive. If the system(s) that the drive is installed in are not capable of meeting the characteristics listed below, please use a WD drive that matches your system(s)' capability. Operating drives outside any of the reliability characteristics below will result in a higher AFR.

Table 2-11. Reliability Specification and Characteristics

| Reliability Specification                                    |            |
|--|------------|
| Average AFR over the Limited Warranty Period <sup>1</sup>    | 0.90%      |
| Reliability Characteristics                                  |            |
| Drive Temperature  | 40°C       |
| Annual Power on Hours (POH)                                  | <=8760     |
| Total Workload over the Limited Warranty Period <sup>2</sup> | <=180TB/Yr |

<sup>1</sup> AFR specifications are based on a sample population and are estimated by statistical measurements and acceleration algorithms under typical operating conditions: workload of 90TB/year and drive temperature of 40°C. Derating of AFR will occur above these parameters, up to 65°C drive temperature. AFR does not predict an individual drive's reliability and does not constitute a warranty.

<sup>2</sup> Annualized Workload Rate = TB transferred x (8760 / recorded power-on hours)

## 2.7 Connectors and Cables

### 2.7.1 Serial ATA Connectors

For information on SATA data connectors, including the pin definitions of the SATA connectors and the corresponding signal names and signal functions, refer to the latest SATA specification available for download at [www.serialata.org](http://www.serialata.org).

### 2.7.2 Cabling Requirements for Serial ATA

The SATA cable consists of four conductors in two differential pairs. The cable may also include drain wires to be terminated to the ground pins in the SATA cable

receptacle connectors. See the SATA specification for cable specifications. The cable's maximum length is one meter.

## 2.8 Agency Approvals

### PR2000M-3 Regulatory Number (R/N): 810051

These drives meet the standards of the following regulatory agencies:

- **Federal Communication Commission:** Verified to comply with FCC Rules for Radiated and Conducted Emission, Part 15, Subpart B, for Class B Equipment.
- **Underwriters Laboratories:** Bi-National UL Standard CAN/CSA-C22.2 No. 60950/UL 60950-1. Standard for Safety of Information Technology Equipment, including Electrical Business Equipment.
- **TUV:** IEC 60950-1 per EN 60950-1, Standard for Safety of Information Technology Equipment, including Electrical Business Equipment.
- **CE Compliance for Europe Countries and Morocco:** Verified to comply with EN55032:2015 for RF Emissions and EN55024:1998, A1:2001 + A2:2003, EN61000-3-2:2000, EN61000-3-3:1995 + A1:2001 for Generic Immunity as applicable.
- **RCM Compliance for Australia and New Zealand:** Verified to comply with AS/NZ3548 for RF Emissions as required by the Australian Communications Authority.
- **Korean KC Mark:** Registered as a Class-B product with the South Korean Ministry of Information and Communication.
- **Taiwan BSMI ROHS Compliance:** Certified as a Class-B product with the Bureau of Standards Metrology and Inspection (BSMI ROHS).

## 2.9 Full Model Number Specification

Table 2-12 below provides a summary specification of the model number suffix for this product platform.

Table 2-12. Full Model Number Description

| Model Number Format | ID  | Product Brand | Description                          |
|---------------------|-----|---------------|--------------------------------------|
| WD63PURU-69C4FYx    | C4F | WD Purple     | PR2000M-3 SVR 6TB 256 MB SATA 6 Gb/s |
| WD42PURU-69C4CYx    | C4C | WD Purple     | PR2000M-3 SVR 4TB 256 MB SATA 6 Gb/s |

## 3.0 PRODUCT FEATURES

- SATA 6 Gb/s
- AllFrame 4K™ Technology
- Premium Protection
- IntelliSeek™
- Dynamic Fly Height Control
- Perpendicular Magnetic Recording (PMR)
- NoTouch™ Ramp Load Technology
- Dual Actuator Technology
- Advanced Format (AF)
- Native Command Queuing (NCQ)
- Pre-emptive Wear Leveling (PWL)
- S.M.A.R.T. Command Transport (SCT)
- World Wide Name (WWN)
- Reliability Features Set
- Hot Plug Support
- Active LED Status
- Fluid Dynamic Bearings (FDB)
- Staggered Spin-Up and Activity Indication (SATA Power Pin 11)
- Power Management
- Self-Monitoring, Analysis, and Reporting Technology (S.M.A.R.T.)
- Security Mode

### 3.1 SATA 6 Gb/s

SATA 6 Gb/s is the latest generation interface for SATA hard drives with the following features:

- **Native Command Queuing (NCQ)** — server feature for performance in random I/O transaction environments. It aggregates many small random data transfers and allows the disk to reorder the commands in a sequential order for faster access.
- **Improved Power Management** — provides improved power management features including Host Initiated SATA Power Management (HIPM) and Device Initiated SATA Power Management (DIPM).
- **Staggered Spin-up** — allows the system to control whether the drive will spin up immediately or wait until the interface is fully ready before spinning up.
- **Asynchronous Signal Recovery (ASR)** — robustness feature that improves signal recovery.
- **Enclosure Services** — defines external enclosure management and support features.
- **Backplane Interconnect** — defines how to lay out signal line traces in a backplane.
- **Auto-activate DMA** — provides increased command efficiency through automated activation of the DMA controller.

### 3.2 AllFrame 4K™ Technology

All WD Purple™ drives are equipped with AllFrame 4K™ technology, which improves ATA streaming to help reduce frame loss, improve overall video playback, and increase the number of hard drive bays supported within a NVR. Help make your surveillance solution future-ready knowing that WD Purple™ drives are ready for ultra high definition cameras.

### 3.3 Premium Protection

Designed with tarnish-resistant components, this WD Purple drive offers premium protection in harsh environments where surveillance systems may be installed.

### 3.4 IntelliSeek

Western Digital's unique IntelliSeek technology proactively calculates an optimum seek speed to eliminate hasty movement of the actuator that produces noise and requires power, which is common in other drives. With IntelliSeek, the actuator's movement is controlled so the head reaches the next target sector just in time to read the next piece of information, rather than rapidly accelerating and waiting for the drive rotation to catch up. This smooth motion reduces power usage by more than 60 percent compared with standard drives, as well as quiets seek operation and lowers vibration.

### 3.5 Dynamic Fly Height Control

This feature is designed to compensate for head/media separation changes due to temperature and altitude. It adds video quality margins across temperature and altitude changes.

### **3.6 Perpendicular Magnetic Recording (PMR)**

In perpendicular magnetic recording (PMR), the magnetization of each data bit is aligned vertically to the spinning disk, rather than longitudinally as has been the case in hard drive technology for decades.

In perpendicular recording, the adjacent bits attract instead of repel (as with bar magnets placed side by side), creating more thermally stable bits. In addition, the media contains a magnetically soft underlayer (SUL) beneath the recording layer. This SUL allows a larger effective write field, thus higher coercivity media, enabling further increases in density. Lastly, because of the vertical orientation of the bits, the PMR recording layer tends to be thicker than that used for longitudinal recording, providing increased signal for the read heads. All of these benefits enable WD engineers to reliably pack more data on a given disk than is possible with conventional longitudinal recording.

### **3.7 NoTouch Ramp Load Technology**

Parks the recording heads off the disk surface during spin up, spin down and when the drive is off. This ensures the recording head never touches the disk surface resulting in improved long term reliability due to less head wear, and improved non-operational shock tolerance.

### **3.8 Dual Actuator Technology**

A head positioning system with dual-stage actuators that improves positioning accuracy over the data track(s). The primary stage provides course displacement; the secondary stage uses piezoelectric motion to fine tune the head positioning to a higher degree of precision.

### **3.9 Advanced Format (AF)**

Advanced Format (AF) technology is adopted by Western Digital and other drive manufacturers as one of multiple ways to continue growing hard drive capacities. AF is a more efficient media format that enables increased areal densities.

In AF, each physical sector is composed of eight 512 byte logical sectors, totaling 4096 bytes.

### **3.10 Native Command Queuing (NCQ)**

These drives support Native Command Queuing. NCQ is a true Enterprise feature for environments such as database, Web servers, and e-mail servers.

Performance of a random I/O workload can be improved through intelligent re-ordering of the I/O requests so they read/write to and from the nearest available sectors and minimize the need for additional disk revolutions or head actuator movement. This improvement is achieved through Native Command Queuing (NCQ).

NCQ allows the drive to re-order read commands, thereby increasing random read IOPs. Additional NCQ features that can prove beneficial include a Write Cache disabled IOP increase and a queuing implementation built upon an existing, highly automated cache architecture. Queued reads in NCQ leverage the same re-ordering schemes used for write caching. The firmware design maintains the "order" of overlapping/colliding queued commands. NCQ is designed to excel in multi-threaded environments with high random I/O loads.

### 3.11 Pre-emptive Wear Leveling (PWL)

This Western Digital feature provides a solution for protecting the recording media against mechanical wear. In cases where the drive is so busy with incoming commands that it is forced to stay in a same cylinder position for a long time, the PWL control engine initiates forced seeks so that disk lubricant maintains an even distribution and does not become depleted. This feature ensures reliability for applications that perform a high incidence of read/write operations at the same physical location on the disk.

### 3.12 S.M.A.R.T. Command Transport (SCT)

The SCT Command Transport feature set provides a method for a host to send commands and data to a device and for a device to send data and status to a host using log pages. Standard ATA commands may be interspersed with SCT commands, but SCT commands cannot be nested. SCT commands that do not require a subsequent data transfer operation are not interspersed with any ATA commands or each other.

The SCT Command Transport feature set provides a method for a host to send commands and data to a device and for a device to send data and status to a host using log pages. This capability is used to pass commands through a driver interface or a bridge where new or unknown commands may be filtered and not passed to the drive. SCT is also used for issuing commands that require more than 8 parameter bytes. ATA8-ACS provides detailed information on the usage and capabilities of SCT. The SCT feature set includes the following commands:

- Write Same
- Temperature Reporting

#### 3.12.1 Write Same

The Write Same command allows the host to erase the media, or write a pattern repeatedly across the media, with a minimum of data transfer from the host. The host can clear the entire media to zeros or a specific pattern by sending this command with the pattern as a parameter—no data transfer is necessary. Write Same can write the entire media, or just a portion of the media. The host can monitor the progress of the Write Same by issuing SCT Status requests. This frees the host system to do other tasks while the media is being cleared.

#### 3.12.2 Temperature Reporting

The SCT Temperature Reporting (SCT TR) feature allows a host system to access temperature information in the drive. The S.M.A.R.T. temperature value is reported within  $\pm 3^{\circ}\text{C}$  of the drive temperature. This information can be used to control fans or adjust the usage of various system components to keep the drive within its normal operating temperature. Applications include Enterprise, Laptop, Desktop and Consumer Electronics. SCT TR reports the maximum and minimum sustained operating limits, warning level limits, and drive damage limits. In addition to reporting the limits, SCT TR returns the current drive temperature (a temperature history which the host can use to predict heating or cooling trends) and the maximum temperature achieved during the lifetime of the drive as well as the highest temperature achieved since the power was applied to the drive. Detailed information on this capability can be found in ATA8-ACS.

### 3.13 World Wide Name (WWN)

It has become a critical requirement that hard drives be uniquely identified by computer systems. This allows a drive to maintain its identity as it is transported from system to system or placed on a network. IEEE has defined a format for serial numbers that is widely recognized in the computing industry by adding World Wide Name (WWN) to ATA/ATAPI-7 in 2002.

The World Wide Name (WWN) defined in ATA/ATAPI-7 is a modification of the IEEE Extended Unique Identifier 64 bit standard (EUI-64) and is comprised of three major components: naming authority, organizationally unique identifier (OUI) and serial number. Western Digital's OUI is 0014EEh.

### 3.14 Reliability Features Set

#### 3.14.1 Data Lifeguard™

Representing Western Digital's ongoing commitment to data protection, Data Lifeguard includes features that enhance the drives ability to prevent data loss. Data Lifeguard data protection features include thermal management, an environmental protection system, and embedded error detection and repair features that automatically detect, isolate, and repair problem areas that may develop over the extended use of the hard drive. With these enhanced data reliability features, the drive can perform more accurate monitoring, error repair, and deliver exceptional data security.

All Western Digital drives are defect-free and low-level formatted at the factory. After prolonged use, any drive, including a Western Digital drive, may develop defects.

**CAUTION:** As with all format utilities, some options in the Data Lifeguard Diagnostics utility will overwrite user data.

Download the latest versions of the Data Lifeguard Diagnostic and Data Lifeguard Tools programs at [support.wdc.com](http://support.wdc.com).

#### 3.14.2 Thermal Management

The drive is designed with Thermal Management features for high reliability.

- **State-of-the-Art Mechanical Design**—Mechanical design is optimized to reduce the drive's temperature. State-of-the-art thermal dissipation and windage design is employed.
- **Closed Loop Servo Management**—Thermal management monitors the drive temperature and can control servo operations to maintain a stable operating temperature under high temperature conditions. This is a closed loop servo and thermal control system.
- **S.M.A.R.T. HDA Temperature Attribute**—The S.M.A.R.T. HDA Temperature Attribute is supported. The S.M.A.R.T. temperature value is reported within  $\pm 3^{\circ}\text{C}$  of the drive temperature.
- **Ducted Airflow**—Provides protection to the Read/Write element from heated air.

### 3.14.3 Internal Environmental Protection System

This dual filter system protects the inside environment of the drive from contamination. System features include:

- Dual Filtration System to ensure fast clean-up times
- Directed airflow to maximize mechanical cooling
- Increase casting surface area to maximize cooling
- Ducted air flow to protect Read Rite elements from heated air
- Enhanced heat dissipation

### 3.14.4 Recoverable Errors

A sector marked for repair is written back to the same location. The sector is then read several times to be sure that it was written correctly and that there is no media damage at its location (sector test). If the sector does not easily and consistently read correctly, the sector is then relocated with original data.

### 3.14.5 Self Test

Self Test is a quick way to determine the operation status of a drive. The following Self Tests are supported:

- **Quick Test:** Completes in less than two minutes.
- **Extended Test:** Tests all the critical subsystems of the drive.
- **Conveyance Test:** Quickly identifies issues caused by handling damage.
- **Selective Test:** Scans host-defined sections of the drive.

The test may be run to completion or be performed as a background task as the drive processes other commands from the host. The host may then poll the drive for runtime status and test results. Since the test is embedded in the drive's firmware, it is always available, requires no installation and can be faster and more effective than a software-based drive test.

### 3.14.6 ATA Error Logging

ATA Error Logging provides an industry standard means to record error events and supporting information that is then accessible by the host. The event record includes the exact command that caused the failure, the response of the drive, the time of the event and information about the four commands immediately prior to the errant command. Error Logging can reliably and quickly determine whether a system problem is the result of a hard drive failure or other component malfunction. Error Logging retains total error count for the life of the drive and complete records for the last five errors.

### 3.14.7 Defect Management

Every Western Digital drive undergoes factory-level intelligent burn in, which thoroughly tests for and maps out defective sectors on the media before the drive leaves the manufacturing facility. Following the factory tests, a primary defect list is created. The list contains the cylinder, head, and sector numbers for all defects.

Defects managed at the factory are sector slipped. Grown defects that can occur in the field are mapped out by relocation to spare sectors on the inner cylinders of the drive.

### 3.15 Automatic Defect Retirement

The automatic defect retirement feature automatically maps out defective sectors while reading or writing. If a defective sector appears, the drive finds a spare sector.

The following item is specific to automatic defect retirement on writes (write auto-relocation):

- Data is always written to disk (using automatic defect retirement if required) and no error is reported.

The following item is specific to automatic defect retirement on reads (read auto-relocation):

- When host retries are enabled, the drive will internally flag any unrecoverable errors (DAMNF or ECC). This flagging allows subsequent write commands to this location to relocate the sector only if the sector test fails.

#### 3.15.1 Error Recovery Process

The drive has five means of error recovery:

- ECC On-the-Fly
- Preamp Thermal Asperity (TA) Compensation
- Read/Write Retry Procedure
- Extended Read Retry Procedure

**ECC On-the-Fly** – If an ECC error occurs, the drive attempts to correct it on-the-fly without retries. Data can be corrected in this manner without performance penalty. The details of the correction algorithm appear in the next section.

**Preamp Thermal Asperity Compensation** – A Thermal Asperity (TA) is a baseline shift in the readback signal due to heating of the magnetoresistive stripe on the head as a result of physical contact with the disk or a particle. The preamp circuit has the ability to detect and compensate for thermal asperities. When an error cannot be corrected by ECC On-the-Fly, another retry is performed, where the preamp with its thermal asperity detection feature determines if the error is due to a thermal asperity. Once the preamp determines that the error is due to thermal asperity, preamp compensation is enabled. If preamp compensation alone is not enough to recover, then the channel performs a series of TA-specific recoveries.

**Read/Write Retry Procedure** – This retry procedure is used by all disk controller error types. If the procedure succeeds in reading or writing the sector being tried, then recovery is complete and the controller continues with the command. Each retry operation also checks for servo errors. The procedure ends when error recovery is achieved or when all possible retries have been attempted.

**Extended Read Retry Procedure** – This retry procedure tries combinations of positive/negative track offsets and data DAC manipulations to recover the data. This retry procedure applies only to read data recovery. The Read/Write Retry procedure performs the actual retry operation.

When an extended retry operation is successful, the controller continues with the command. The controller clears any changes in track offset or data DAC settings before the command continues.

### 3.16 Hot Plug Support

SATA supports hot plugging (also known as "hot swapping"), the ability to swap out a failed hard drive without having to power down the system or reboot. This capability contributes to both data availability and serviceability without any associated downtime, making it a critical feature for extending SATA into enterprise applications.

These Western Digital hard drives support hot plugging only in systems where a SATA hard drive storage backplane is used.

The Serial ATA revision 2.5 specification requires staggered pins for both the hard drive and drive receptacles. Staggered pins mate the power signals in the appropriate sequences required for powering up the hot plugged device. These pins are also specified to handle in excess of the maximum allowed inrush current that occurs during drive insertion. SATA-compliant devices thus need no further modification to be hot pluggable and provide the necessary building blocks for a robust hot plug solution, which typically includes:

- Device detection even with power downed receptacles (typical of server applications).
- Pre-charging resistors to passively limit inrush current during drive insertion.
- Hot plug controllers to actively limit inrush current during drive insertion.

### 3.17 Active LED Status

The drive supports external LED requirements. It provides an activity LED pin which is ON during command execution and OFF otherwise.

The drive strength of this open drain drive active signal is that it can sink 12mA to 0.4V Max. It is 5V tolerant, meaning that the external LED may be driven from +5V or +3.3V so long as the Host system provides a series resistor to limit the LED current to the lower of 12mA or the rated operating current of the LED. As an example with +5V and a 2 volt forward drop across a 10mA LED, a 300 Ohm 5% 1/16W resistor would be suitable. In the case of a 3.3V supply for the same LED, the resistor would be 130 Ohm 5% 1/16W.

The pin corresponding to P11 shall be used for Active LED (see *Section 2.7 Connectors and Cables on page 18*).

### 3.18 Fluid Dynamic Bearings (FDB)

Bearing design that incorporates a layer of high-viscosity lubricant instead of ball bearings in the hard drive spindle motor. As an alternative to conventional ball bearing technology, FDB designs provide increased non-operational shock resistance, speed control, and improved acoustics.

### 3.19 Staggered Spinup and Activity Indication (SATA Power Pin 11)

*Note:* This feature is available for specific OEM configurations.

SATA device power connector pin 11 is defined as a means by the host to DISABLE staggered spinup and it may also be used by the device to provide the host with an activity indication. According to the SATA specification, "Staggered Spin-up Disable and Activity Signal shall not be enabled at the same time."

### 3.20 Power Management

This drive supports the ATA power management commands that lower the average power consumption of the hard drives. For example, to take advantage of the lower power consumption modes of the drive, an energy efficient host system could implement a power management scheme that issues a Standby Immediate command when a host resident disk inactivity timer expires. The Standby Immediate command causes the drive to spin down and enter a low-power mode. Subsequent disk access commands would cause the drive to spin up and execute the new command. To avoid excessive wear on the drive due to the starting and stopping of the HDA, set the host's disk inactivity timer to no shorter than ten minutes.

The drive also supports the SATA power management feature that lowers the average power consumption of the SATA interface.

### 3.21 Self-Monitoring, Analysis, and Reporting Technology (S.M.A.R.T.)

S.M.A.R.T. helps you monitor a drive's internal status through diagnostic commands at the host level.

The drive monitors Read Error Rate, Start/Stop Count, Re-allocated Sector Count, Seek Error Rate, Power-on Hours Count, Spin-up Retry Count, Drive Calibration Retry Count, Drive Power Cycle Count, Offline Scan Uncorrectable Sector Count, Ultra ATA CRC Error Rate, Multi-zone Error Rate, Spin-up Time, Relocation Event Count, and Current Pending Sector Count. The hard drive updates and stores these attributes in the reserved area of the disk. The drive also stores a set of attribute thresholds that correspond to the calculated attribute values. Each attribute threshold indicates the point at which its corresponding attribute value achieves a negative reliability status.

### 3.22 Security Mode

The Security Mode feature set allows the user to create a device lock password that prevents unauthorized hard drive access even if the drive is removed from the computer. This feature varies by drive configuration and may not be available on all configurations.

#### 3.22.1 Master and User Passwords

The manufacturer/dealer can set a master password using the Security Set Password command, without enabling the device lock function. The user password should be given or changed by a system user.

Master Password Identifier is supported and set to a default value of 00FE. If a Master Password is set via a Security Set Password Command, a valid Master Password Revision code value of 0001h – FFEh must be used. A Master Password Identifier of 0000h is ignored.

When the master password is set, the drive does not enable the device lock function. When the user password is set, the drive enables the device lock function, and the drive is locked after the next power on reset or hard reset.

### 3.22.2 Security Levels

**High** - If High level security is set and the user password is forgotten, the master password can be used to unlock the drive and access the data.

**Maximum** - If Maximum level security is set and the user password is forgotten, data access is impossible. Only the master password with a Security Erase Unit command can unlock the drive when the device lock function is enabled and the user password has been forgotten. When the Security Erase Unit command is used to unlock the drive, all user data is erased.

## 4.0 ATA COMMAND SET

### 4.1 Host Interface Commands

#### 4.1.1 ATA Commands Set (ACS)

Table 4-1 lists the hexadecimal codes specific to each ACS command supported by these hard drives. Refer to the ACS specification for full details on each command.

Table 4-1. ATA-8 Command Opcodes

| COMMAND                   | HEX OPCODE |
|---------------------------|------------|
| CHECK POWER MODE          | E5         |
| DOWNLOAD MICROCODE        | 92         |
| EXECUTE DEVICE DIAGNOSTIC | 90         |
| FLUSH CACHE               | E7         |
| FLUSH CACHE EXT           | EA         |
| IDENTIFY DEVICE           | EC         |
| IDLE                      | E3         |
| IDLE IMMEDIATE            | E1         |
| NOP                       | 00         |
| READ BUFFER               | E4         |
| READ DMA                  | C8         |
| READ DMA EXT              | 25         |
| READ FPDMA QUEUED         | 60         |
| READ LOG EXT              | 2F         |
| READ LOG DMA EXT          | 47         |
| READ MULTIPLE             | C4         |
| READ MULTIPLE EXT         | 29         |
| READ SECTOR(S)            | 20         |
| READ SECTORS(S) EXT       | 24         |
| READ VERIFY SECTOR(S) EXT | 42         |
| READ VERIFY SECTORS(S)    | 40         |
| S.M.A.R.T.                | B0         |
| SECURITY DISABLE PASSWORD | F6         |
| SECURITY ERASE PREPARE    | F3         |
| SECURITY ERASE UNIT       | F4         |
| SECURITY FREEZE LOCK      | F5         |
| SECURITY SET PASSWORD     | F1         |
| SECURITY UNLOCK           | F2         |
| SET FEATURES              | EF         |
| SET MULTIPLE              | C6         |
| SLEEP                     | E6         |
| STANDBY                   | E2         |
| STANDBY IMMEDIATE         | E0         |
| WRITE BUFFER              | E8         |
| WRITE DMA                 | CA         |
| WRITE DMA EXT             | 35         |
| WRITE FPDMA QUEUED        | 61         |
| WRITE LOG EXT             | 3F         |
| WRITE LOG DMA EXT         | 57         |
| WRITE MULTIPLE            | C5         |
| WRITE MULTIPLE EXT        | 39         |
| WRITE SECTOR(S)           | 30         |
| WRITE SECTOR(S) EXT       | 34         |

### 4.1.2 SCT Commands

SCT commands provide capabilities for commands that do not fit the ATA command delivery model. Some SCT commands report completion when the command begins execution. Execution progress for these commands may be checked by requesting SCT status. For instance, the host can track the progress of a Write Same command by issuing a status request once per minute. See ACS for a full description of SCT.

Table 4-2. SCT Action Codes

| ACTION CODE | DESCRIPTION                |
|-------------|----------------------------|
| 0000h       | RESERVED                   |
| 0002h       | Write Same                 |
| 0003h       | SCT Error Recovery Control |
| 0004h       | Features Control           |
| 0005h       | SCT Data Tables            |

## 4.2 S.M.A.R.T. (B0h)

The S.M.A.R.T. command provides access to attribute values, S.M.A.R.T. status, and other S.M.A.R.T. information. These commands can be used for logging and reporting purposes, and for accommodating special user needs.

Prior to writing the S.M.A.R.T. command to the Command Register, the host must write key values into the LBA Mid and LBA High Registers (4Fh, C2h) or the command will be aborted and an error will be reported.

The S.M.A.R.T. command has several sub-commands that are selectable via the Features Register when the host issues the S.M.A.R.T. command. To select a sub-command, the host must write the appropriate sub-command code to the Features Register before issuing the S.M.A.R.T. command. The sub-commands and their respective codes are listed below. For more detailed information on executing S.M.A.R.T. commands, see the ACS specification.

#### 4.2.1 Read Data Sub-Command

This command returns a sector of data with the drives S.M.A.R.T. data structure.

Table 4-3. Definitions for the 512 Bytes

| BYTE      | VALUE | DESCRIPTION  |
|-----------|-------|--|
| 0 - 1     | 0001h | S.M.A.R.T. Data Structure Revision   |
| 2 - 361   | XX    | S.M.A.R.T. Attribute Data  |
| 135 - 361 | XX    | S.M.A.R.T. Attribute Data  |
| 362       | XX    | Offline data collection status<br>0Xh OL disabled<br>8Xh OL enabled<br>X0h scan not run<br>X2h scan complete<br>X4h scan suspended<br>X5h scan aborted   |
| 363       | XX    | Self-Test execution status byte.<br>00h The previous self-test routine completed without error or no self-test has ever been run<br>01h The self-test routine was aborted by the host<br>02h The self-test routine was interrupted by the host with a hard or soft reset<br>03h A fatal error or unknown test error occurred while the device was executing its self-test routine. The device was unable to complete the self-test routine.<br>04h The previous self-test completed having a test element that failed. The test element that failed is not known.<br>05h The previous self-test completed having a test element that failed. The electrical element of the test failed.<br>06h The previous self-test completed having a test element that failed. The servo (and/or seek) test element of the test failed.<br>07h The previous self-test completed having a test element that failed. The read element of the test failed.<br>08h The previous self-test completed having a test element that failed. The element damage is suspected to be caused by handling.<br>09-0Eh Reserved<br>0Fh Self-test routine in progress |
| 364 - 365 | XX    | Total time in seconds to complete offline data collection activity   |
| 366       | XX    | Reserved   |
| 367       | 7Bh   | Offline data collection capability. Bits are as follows:<br>0 1 = Offline Immediate Command supported<br>1 1 = Auto Offline enable\disable command supported<br>2 0 = Offline will suspend on and will resume after host command<br>3 1 = Offline read scan implemented<br>4 1 = DST Short and Extended tests supported<br>6-7 0 - Reserved  |
| 368 - 369 | 0003h | S.M.A.R.T. Capability. Bits are as follows:<br>0 1 = The device saves SMART data prior to going into a power saving mode<br>1 1 = Device complies with SMART data autosave after an event<br>2-15 Reserved   |
| 370       | 01h   | Error logging capability. Bits are as follows:<br>0 1 = Error logging supported<br>1 Reserved  |
| 371       | XX    | Reserved   |
| 372       | XX    | Short self-test routine completion time in minutes   |
| 373       | XX    | Extended self-test routine completion time in minutes  |
| 375 - 510 | XX    | Reserved   |
| 511       | XX    | Checksum   |

#### 4.2.2 Supported Attributes

The drive supports the following attributes.

Table 4-4. Supported Attributes

| Attribute                               | Attribute ID Number | Pre-Failure/Advisory Bit (Status Flags bit 0) <sup>1</sup> |
|---|---------------------|--|
| Read Error Rate                         | 1                   | Pre-Failure  |
| Spin-up Time                            | 3                   | Pre-Failure  |
| Start/Stop Count                        | 4                   | Advisory   |
| Re-allocated Sector Count               | 5                   | Pre-Failure  |
| Seek Error Rate                         | 7                   | Advisory   |
| Power-on Hours Count                    | 9                   | Advisory   |
| Spin-up Retry Count                     | 10                  | Advisory   |
| Drive Calibration Retry Count           | 11                  | Advisory   |
| Drive Power Cycle Count                 | 12                  | Advisory   |
| Emergency Retract Cycles                | 192                 | Advisory   |
| Load/Unload Cycles                      | 193                 | Advisory   |
| HDA Temperature                         | 194                 | Advisory   |
| Relocation Event Count                  | 196                 | Advisory   |
| Current Pending Sector Count            | 197                 | Advisory   |
| Offline Scan Uncorrectable Sector Count | 198                 | Advisory   |
| Ultra ATA CRC Error Rate                | 199                 | Advisory   |
| Multi-zone Error Rate                   | 200                 | Advisory   |

<sup>1</sup> Status bits are typical but may vary.

Attributes that use the Pre-Failure/Advisory Bit Set can predict potential future degrading or faulty conditions. Attributes with the Failure/Advisory Bit Clear are used for informational purposes only, they do not indicate impending drive failure.

The S.M.A.R.T. data saving process is a background task. After a pre-determined idle period, the self-monitoring data is automatically saved to the disk.

### 4.2.3 Read Log Sector

There are several logs that can be read with the S.M.A.R.T. Read Log Sector sub-command. The LBA Low Register indicates the log sector to be returned.

Table 4-5. Log Address Definition

| Log Address | Log Name                               | Feature Set    | R/W      | Access  |
|-------------|--|----------------|----------|---------|
| 00h         | Log directory                          | ExtLog         | RO       | GPL, SL |
| 01h         | Summary Log                            | SMART          | RO       | SL      |
| 02h         | Comprehensive SMART error log          | SMART          | RO       | SL      |
| 03h         | Extended Comprehensive SMART error log | ExtLog         | RO       | GPL     |
| 04h         | Device Statistics                      | N/A            | RO       | GPL, SL |
| 05h         | Reserved                               | Reserved       | Reserved |         |
| 06h         | SMART self-test log                    | SMART          | RO       | SL      |
| 07h         | Extended SMART self-test log           | ExtLog         | RO       | GPL     |
| 08h         | Reserved                               | Reserved       | Reserved |         |
| 09h         | Selective self-test log                | SMART          | R/W      | SL      |
| 0Ah-0Fh     | Reserved                               | N/A            | Reserved |         |
| 10h         | NCQ Command Error                      | NCQ            | RO       | GPL     |
| 11h         | SATA PHY Counters                      | ExtLog         | RO       | GPL     |
| 12h-17h     | Reserved for Serial ATA                | N/A            | Reserved |         |
| 18h-1Fh     | Reserved                               | N/A            | Reserved |         |
| 20h         | Obsolete                               |                |          |         |
| 23h         | Obsolete                               |                |          |         |
| 24h-7Fh     | Reserved                               | N/A            | Reserved |         |
| 80h-9Fh     | Host vendor specific                   | SMART / ExtLog | R/W      | GPL, SL |
| A0h-BFh     | Device vendor specific                 | SMART / ExtLog | VS       | GPL, SL |
| C0h-EFh     | Reserved                               | Reserved       | Reserved |         |
| E0h         | SCT Command/Status                     | N/A            | R/W      | GPL, SL |
| E1h         | SCT Data Transfer                      |                |          | GPL, SL |
| E2h-FFh     | Reserved                               | Reserved       | Reserved |         |

RO – Read Only

R/W – Read / Write

SMART – Supported by B0h command code.

ExtLog – Supported by 2Fh/3Fh command code.

VS – Vendor Specific

SCT – SMART Command Transport

### 4.3 Identify Device (ECh)

The Identify Device command transfers 512 bytes of data that specify the drives parameters. Table 4-6 lists the parameters read by the host.

Table 4-6. Identify Device Command

| WORD  | FIELD DESCRIPTION   | VALUE                                      |
|-------|---|--|
| 0     | General Configuration   | 427Ah                                      |
| 1     | Obsolete  | 3FFFh                                      |
| 2     | Specific Configuration  | XXXX                                       |
| 3     | Obsolete  | 0010h                                      |
| 4-5   | Retired   | 0  |

<sup>1</sup> Changes are only valid while power remains applied to the drive. After power is cycled, the drive reverts to the default settings.

## 5.0 INSTALLATION AND SETUP PROCEDURES

Hard drives are precision instruments that must be handled with care to prevent damage. It is important to understand that drives are typically damaged because of Electrostatic Discharge (ESD), rough handling, or shock and vibration. Refer to the *WD Hard Drive Handling document (part number 2178-800020)* for details on drive handling.

Refer to <http://support.wdc.com/warranty> for detailed instructions on all phases of repackaging the drive.

**IMPORTANT:** If your system does not support hot plugging (see *Section 3.16 Hot Plug Support on page 27*), it must be turned off and unplugged before installing your hard drive.

### 5.1 Unpacking

#### 5.1.1 Handling Precautions

WD products are designed to withstand normal handling during unpacking and installation. Take care to avoid excessive mechanical shock or electrostatic discharge (ESD), which can permanently damage the hard drive and void the warranty. Hard drives are typically damaged because of ESD, rough handling, or shock and vibration.

To avoid ESD problems, wear a properly grounded wrist strap when handling the hard drive. Articles of clothing generate static electricity. Do not allow clothing to come in direct contact with the hard drive or circuit board components.

When the WD drive is not in its shipping container or installed in its proper host enclosure, it must remain in the anti-static bag. To prevent damage, do not unpack your WD drive until you are ready to install it.

#### 5.1.2 Inspection of Shipping Container

Carefully examine the container for obvious shipping damage, such as: holes, signs of crushing, or stains. Notify the carrier and your WD representative if you observe any shipment damage. Always move the shipping container in the upright position indicated by the arrows on the container.

#### 5.1.3 Removal From Shipping Container

Remove the WD drive from the shipping container only for inspection or installation. Carefully open the box. When removing the WD drive from the box, follow these precautions:

- Grasp the drive by the sides only; avoid touching the circuit board components.
- Gently place the drive on its anti-static bag on a clean, level, grounded work area.
- Do not stack drives or stand the WD drive on its edge.

**CAUTION:** When removing the drive from the shipping container, be careful not to drop it. Dropping the drive can severely damage the head disk assembly or printed circuit board.

#### 5.1.4 Removal from Static Shielding Bag

Before removing the drive from its static shielding bag:

- Make sure that your work station is properly grounded.
- Wear a properly grounded wrist strap with good skin contact.
- Avoid contact with any component on the printed circuit board.

After attaching your wrist strap, gently remove the drive from the static shielding bag.

- Handle the drive by the sides only; avoid touching the printed circuit board.
- Do not open the drives sealed compartment or remove the seals or any labels from the drive; this will void the warranty.

#### 5.1.5 Moving Precautions

If you need to move your computer, turn off the power to automatically unload the heads. This helps protect the media and the heads from accidental damage due to vibration, moving, or shipping.

## 5.2 Mounting

Use either the four bottom screws or at least four of the side mounting screws to rigidly support the drive and prevent vibration. Some adapter frames may not have the mechanical design structure capable of mounting the drive to meet the specified shock and vibration requirements.

The hard drive itself does not provide electrical isolation between mounting locations and drive ground connection. If electrical isolation is required, the system designer or integrator would be responsible for providing a solution.

#### 5.2.1 Mounting Restrictions

If your system does not support hot plugging (see *Section 3.16 Hot Plug Support on page 27*), it must be turned off and unplugged before installing your hard drive.

#### 5.2.2 Orientation

You can mount the hard drive in the X, Y, or Z axis, depending upon the physical design of your system. For best results, mount the drive with all four screws grounded to the chassis. If all four screws are not used, see *Section 5.2.4 Grounding on page 45*.

#### 5.2.3 Screw Size Limitations

The hard drive should be mounted to the chassis using four 6-32 screws. Recommended screw torque is 5 in-lb. Maximum screw torque is 10 in-lb.

**CAUTION:** Screws that are too long can damage the hard drive. Hard drive screw penetration can differ between products depending upon hard drive design. WD's minimum design criteria is to always meet the SFF 8301 industry standard specification. The industry standard as defined in the SFF 8301 specifies a maximum of 3 mm screw penetration, and for a minimum of 2.4 mm of thread engagement from both the screw and the hard drive.

See Figure 2-1 for allowable fastener penetration for this product family.

### 5.2.4 Grounding

The PCBA and HDA grounds are always connected together in the drive and cannot be disconnected. The drive mounting screws, unless intentionally isolated, will provide additional ground connections between the HDA and the system chassis. If the drive isn't grounded via mounting screws as described under *Section 5.2 Mounting on page 44*, there may be increased electrical emissions (EMI).

## 5.3 Hard Drive Installation

If your system does not support hot plugging (see *Section 3.16 Hot Plug Support on page 27*), it must be turned off and unplugged before installing your hard drive.

### 5.3.1 Attach the Power Supply Cable

If your system does not support hot plugging (see *Section 3.16 Hot Plug Support on page 27*), it must be turned off and unplugged before installing your hard drive. This avoids the possibility of reversing the polarity of the power connections and eliminating current surges that can damage either the drive or computer.

Attach the SATA power supply cable to the SATA device plug power connector. The SATA power connector is keyed to ensure proper insertion.

Figure 5-1. Connector Locations

### 5.3.2 Attach SATA Interface Cable

You can configure the hard drive two ways:

1. Cable the drive directly to a SATA connector on the motherboard, or
2. Cable the drive to a host adapter card mounted in one of the expansion slots in the computer.

Both configurations use a SATA interface cable.

Make sure the SATA interface cable is no longer than 1 meter (39.37 inches) to minimize noise that is induced on the data and control buses.

Figure 5-2. SATA Interface Cable

## 5.4 Serial ATA Latching Connector

This hard drive also allows Serial ATA latching cable connections. The latching connector provides a secure connection between the drive and the cable connector via a locking latch mechanism. The new latching connector design has two channels, one above the power connection and one above the data connection. Latch alignment with these channels forms an interlock when the latching cable is inserted into the drive. This latching feature makes the SATA connector more robust against breakage and ensures a click-lock connection which is verifiable even in noisy environments.

## 6.0 MAINTENANCE

The hard drive requires no preventative maintenance and contains no user-serviceable parts. The service and repair of drives can only be performed at a WD Service Center. Please contact your WD representative for warranty information and service/return procedures.

Observe the following precautions to prolong the life of the drive:

- Do not attempt to open the sealed compartment of the drive as this will void the warranty.
- Do not lift a drive by the printed circuit board.
- Avoid static discharge when handling a drive.
- Avoid harsh shocks or vibrations.
- Do not touch the components on the printed circuit board.
- Observe the environmental limits specified for this product.
- If it becomes necessary to move your computer system, turn off the power to automatically unload the heads. This helps protect the media and the heads from accidental damage due to vibration while moving or shipping.
- To protect your data, back it up regularly. WD assumes no responsibility for loss of data. For information about back-up and restore procedures, consult your operating system manual. There are also a number of utility programs available that you can use to back up your data.

## 7.0 TECHNICAL SUPPORT

WD provides a wide variety of technical support services on our Internet site at:

<http://support.wdc.com>

## 8.0 THIRD-PARTY NOTICES

This product may include or use the following open source software subject to the following open source licenses. If required by the applicable open source license, Western Digital may provide the open source code to you on request either electronically or on a physical storage medium for a charge covering the cost of performing such distribution, which may include the cost of media, shipping, and handling.

### 8.1 Components:

A portable, fast, and free implementation of the MD5 Message-Digest Algorithm (RFC 1321) 1.10 : Peslyak Public Domain with fallback

LZHUF 4/7/1989 : LZHUF

### 8.2 Licenses:

#### 8.2.1 LZHUF (LZHUF 4/7/1989)

LZHUF.C ©1989 by Haruyasu Yoshizaki, Haruhiko Okumura, and Kenji Rikitake. All rights reserved. Permission granted for non-commercial use.

#### 8.2.2 Peslyak Public Domain with fallback (A portable, fast, and free implementation of the MD5 Message-Digest Algorithm (RFC 1321) 1.10)

This is an OpenSSL-compatible implementation of the RSA Data Security, Inc. MD5 Message-Digest Algorithm (RFC 1321).

Homepage: <http://openwall.info/wiki/people/solar/software/public-domain-source-code/md5>.

Author: Alexander Peslyak, better known as Solar Designer <solar at openwall.com>.

This software was written by Alexander Peslyak in 2001. No copyright is claimed, and the software is hereby placed in the public domain.

In case this attempt to disclaim copyright and place the software in the public domain is deemed null and void, then the software is Copyright (c) 2001 Alexander Peslyak and it is hereby released to the general public under the following terms:

Redistribution and use in source and binary forms, with or without modification, are permitted.

There's ABSOLUTELY NO WARRANTY, express or implied.

(This is a heavily cut-down "BSD license").

This differs from Colin Plumb's older public domain implementation in that no exactly 32-bit integer data type is required (any 32-bit or wider unsigned integer data type will do), there's no compile-time endianness configuration, and the function prototypes match OpenSSL's.

No code from Colin Plumb's implementation has been reused; this comment merely compares the properties of the two independent implementations.

The primary goals of this implementation are portability and ease of use. It is meant to be fast, but not as fast as possible. Some known optimizations are not included to reduce source code size and avoid compile-time configuration.

## 9.0 GLOSSARY

**Active LED Status** — The WD drive supports external LED requirements. It provides an activity LED output which is ON during command execution and OFF otherwise.

**Annualized Failure Rate (AFR)** — A method of measuring failure rates or trends for a group of units at a site. The rates are based on the monthly total number of returned field failure units divided by the total cumulative installed base and multiplied by 12 (to annualize the failure rate).

**Advanced Format (AF)** — Technology adopted by WD and other drive manufacturers as one of multiple ways to continue growing hard drive capacities. AF is a more efficient media format that enables increased areal densities.

**Automatic Defect Retirement** — If defective sectors are found during a read or write, they are automatically mapped out and relocated.

**Block** — A group of bytes handled, stored, and accessed as a logical data unit.

**Buffer** — A temporary data storage area that compensates for a difference in data transfer rates and/or data processing rates between sender and receiver.

**Command Queuing** — See *Native Command Queuing (NCQ)*

**Data Lifeguard™** — Representing WD's ongoing commitment to data protection, Data Lifeguard data protection utilities include thermal management, an environmental protection system, and embedded error detection and repair features that automatically detect, isolate, and repair problem areas that may develop over the extended use of the hard drive.

**Data Transfer Rate** — The rate that digital data is transferred from one point to another, expressed in bits per second or bytes per second.

**Defect Management** — A general methodology of eliminating data errors on a recording surface by mapping out known bad areas of the media.

**Dual Actuator Technology** — A head positioning system with two actuators that improves positional accuracy over the data track(s). The primary actuator provides coarse displacement using conventional electromagnetic actuator principles. The secondary actuator uses piezoelectric motion to fine tune the head positioning to a higher degree of accuracy.

**Dynamic Fly Height Control** — This feature is designed to compensate for head/media separation changes due to temperature and altitude. It adds margins across temperature and altitude changes.

**Error Correction Code (ECC)** — A mathematical algorithm that can detect and correct errors in a data field by adding check bits to the original data.

**F.I.T. (Functional Integrity Testing)** — A suite of tests WD performs on all its drive products to ensure compatibility with different hosts, operating systems, application programs, and peripherals. This testing must be performed before the product can be released to manufacturing.

**Fluid Dynamic Bearings (FDB)** — Bearing design that incorporates a layer of high-viscosity lubricant instead of ball bearings in the hard drive spindle motor. FDB designs provide increased non-operational shock resistance, speed control, and improved acoustics.

**Formatted Capacity** — The actual capacity available to store data in a mass storage device. The formatted capacity is the gross capacity minus the capacity taken up by the overhead data required for formatting the media.

**Hot Plugging** — The ability to swap out a failed hard drive without having to power down the system or reboot.

**IntelliSeek** — WD technology that proactively calculates an optimum seek speed to eliminate hasty movement of the actuator that produces noise and requires power.

**Logical Block Address** — An alternative addressing methodology of identifying a given location on a SATA drive that permits disk sizes greater than 528 MB.

**Native Command Queuing (NCQ)** — NCQ allows the drive to re-order read commands, thereby increasing random read IOPs. NCQ is a true Enterprise feature for environments such as database, Web servers, and e-mail servers.

**NoTouch™ Ramp Load Technology** — The recording head never touches the disk media ensuring significantly less wear to the recording head and media as well as better drive protection in transit.

**Pre-emptive Wear Leveling (PWL)** — WD feature that provides a solution for protecting the recording media against mechanical wear.

**PRML (Partial Response Maximum Likelihood)** — A read channel using sampled data, active equalization and Viterbi detection to accurately retrieve the user data off the disk.

**RoHS (Restriction of Hazardous Substances)** — WD complies with the Restriction of Hazardous Substances (RoHS) Directive 2011/65/EU of the European Parliament, which is effective in the EU beginning July 8, 2011. RoHS aims to protect human health and the environment by restricting the use of certain hazardous substances in new equipment, and consists of restrictions on lead, mercury, cadmium, and other substances..

**Rotational Latency** — The amount of delay in obtaining information from a disk drive that can be attributed to the rotation of the disk. For a disk rotating at 10,000 RPM, the average latency is 3 milliseconds.

**RPM (Revolutions per Minute)** — Rotational speed of the media (disk), also known as the spindle speed. Hard drives spin at one constant speed. The slower the RPM, the higher the mechanical latencies. Disk RPM is a critical component of hard drive performance because it directly impacts the rotational latency and the disk transfer rate.

**Seek Time** — The time it takes for the read/write head to move to a specific block of data on the hard drive. The average seek time is computed by dividing the time it takes to complete a large number of random seeks by the number of seeks performed.

**Data Sector** — A 512-byte packet of data.

**Self-Monitoring, Analysis, and Reporting Technology (S.M.A.R.T.)** — A technology to assist the user in preventing possible system down time due to hard drive failure.

**Serial ATA (SATA)** — SATA is the industry standard bus interface for hard drives. It is designed to replace Parallel ATA, and has many advantages including increased transfer rate, improved signal integrity, enhanced data protection, and hot plugging.

**S.M.A.R.T. Command Transport (SCT)** — The SCT Command Transport feature set provides a method for a host to send commands and data to a device and for a device to send data and status to a host using log pages.

**Staggered Spinup** — SATA feature that allows the system to control whether the drive will spin up immediately or wait until the interface is fully ready.

**Unrecoverable Error** — A read error that cannot be overcome by an ECC scheme or by rereading the data when host retries are enabled.

**World Wide Name (WWN)** — The World Wide Name (WWN) defined in ATA/ATAPI-7 is a modification of the IEEE extended unique identifier 64 bit standard (EUI-64) and is comprised of three major components: naming authority, organizationally unique identifier (OUI) and serial number. WD's OUI is 0014EEh.
